FRIDAY EVENING, APRIL 6.

THE CATERPILLAR-EASY MODE OF EXTER-MINATING THEM .- Mr. Wm. A. Legrand, a farmer of Campbell county, who has an orchard of three or four thousand fruit trees, and has devoted much time and attention to the culture which they can be exterminated. Believing it | reply. will be of advantage to some of our readers, we publish it for their benefit :-

At this season of the year (April) when the sap of the tree begins to rise and the buds put forth, the caterpiliars form a small belt 12 to 15 inches from the end of the twigs, which will be found to contain thousands of eggs; here they hatch and begin to spin a light web, reach ing down to the forks of the branches, where they form a belt of mucilage, on which they feed until strong enough to get to the forks of the tree, where they spin a large web or nest and remain the entire season, feeding on the young leaves.

They can be easily destroyed by pinching off belt and web before they reach the forks of limbs. They are just now making their ap pearance, especially on apple and pear trees, and if the trees are inspected and these suggestions adopted, these creeping insects can be utterly destroyed .- Lynch.
